

Title: Introduction to HTML

Objective:

- To learn about the basic structure of HTML
- To implement basic HTML tags

Theory

1. Introduction

HTML (HyperText Markup Language) is a standard markup language for documents designed to be displayed in a web browser. It describes the structure of a web page using markup tags. These tags can affect how the browser displays elements like text, images, links, media, etc.

HTML is a markup language used to define the structure and visual layout of a web page, along with CSS for styling and JavaScript for interactivity. Websites, whether a simple blog or an advanced web application, are all built on HTML as a foundation.

2. Basic Structure of HTML

All HTML documents have a similar structure, consisting of:

```
<!DOCTYPE html>
<html>
<head>
<title>Page Title</title>
</head>
<body>
Content goes here
</body>
</html>
```

Explanation:

- `<!DOCTYPE html>` → declares the document type.
- `<html>` → Root element of the HTML page.
- `<head>` → contains metadata such as title, links, etc.
- `<title>` → Defines the title that appears in the browser tab.
- `<body>` → The visible content of the webpage.

3. Basic Tags Used in HTML

Some HTML tags that are often used are:

- `<h1>` to `<h6>` → Headings (largest to smallest)
- `<p>` → Paragraph
- `<br>` → Line break
- `<hr>` → Horizontal line
- `<a>` → Anchor tag (used for links)
- `<img>` → Displays images

- `<ul>` → Unordered list
- `<ol>` → Ordered list `<li>` → List items
- `<b>` → Bold text
- `<i>` → Italic text
- For example:

```
<h1>Welcome</h1>
```

```
<p>This is a paragraph.</p>
```

```
<a href="https://example.com">Visit Site</a>
```

- **A simple program to illustrate all basic html tags:**

```
<!DOCTYPE html>
```

```
<html lang="en">
```

```
<head>
```

```
<meta charset="UTF-8">
```

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

```
<title>My frist Webpage</title>
```

```
</head>
```

```
<body>
```

```
<body bgcolor="aqua">
```

```
<div style="background-color:brown;color:white;">
```

```
<h1>Web Technology</h1>
```

```
<p>Web technology refers to the tools, languages, and protocols
```

```
(like HTML, CSS, JavaScript, and HTTP) used for communication,
```

```
content creation, and application development over the internet.
```

```
</p><hr></div>
```

```
<section style="background-color:grey; color: white;">
```

<h2>Introduction to HTML</h2>

<p><pre>HTML (HyperText Markup Language) is the standard markup language used to create the structure and content of web pages.

It is not a programming language but rather a "markup" language that
uses a series of elements to tell a web browser how to display text, images,
and other media</pre></p>

<i>MyPhoto</i>

 italic MyPhoto

“Work hard in silence, let success make the noise.”

Delete

<strike>Same as delete</strike>

<p>(a+b)²=a²+2ab+b²</p>

<p>H₂O</p>

<h3>Heading 3</h3>

<h4>Heading 4</h4>

<h5>Heading 5</h5>

<h6>Heading 6</h6>

</body>

</html>

Output:

Discussion

In this lab, I learned the basic concepts of HTML. I understood how to create an HTML document and the purpose of its main parts, such as the head and body.

These two sections help organize the structure of a webpage.

I also used different HTML tags to format text, create links, and arrange content on a webpage. This made it easier to see how webpages are built.

This exercise helped me understand how web browsers read HTML code and display it as a webpage. Overall, this lab was a good starting point for creating simple web pages and building basic skills in web development.

Conclusion

HTML is the starting point of web development. To create web pages, it is important to understand how to structure content using HTML tags. In this lab, we learned how to use basic HTML structure and tags in a simple way.

Overall, this lab helped us understand the basics clearly, and we were able to achieve the objectives of learning HTML structure and using basic tags.
